

The
Morpheus
DropTune™
gives your
guitar instant
polyphonic
drop tuning
in ½-step
decrements
up to 3 ½
steps —
plus full
Octave and
Octaver.

Now you can go from one pitch for a particular song to a different pitch on the next without having to retune your guitar or owning two, three or more guitars for various step-down de-tunings.

For example, play an E chord in standard tuning, then use this unique pedal to drop tune your guitar so the chord is changed to an E \flat , D, D \flat , C, B, B \flat or A.

This lets guitarists get that heavy drop-tuned tone at different pitches without dealing with floppy string

buzz, extra-heavy-gauge strings or expensive extra guitars. The same goes for foam-deadened acoustic guitars or electric violins.

If your singer has a bad throat night, you can drop-tune ➡

your guitar to accommodate him without having to change neck position or retune.

The Morpheus DROPTUNE™ pedal also features effect-toggling so you can instantly toggle back and forth between the dropped pitch and the EFFECT OFF for a cool up/down pitch-shift effect during solos or power chord rhythm patterns.

In addition, the DROPTUNE pedal has Full Octave Drop and a great-sounding Octaver.

Don't mistake this for a mere pitch shift stompbox. The DROPTUNE uses proprietary polyphonic pitch drop algorithms that maintain perfect harmonic accuracy and tonally-correct overtones — you have to hear this pedal to believe how real it sounds! Not surprising considering the DROPTUNE has been developed by a team of guitar effects pros with over fifty total years of experience at other companies where they created some of today's most famous pedals.

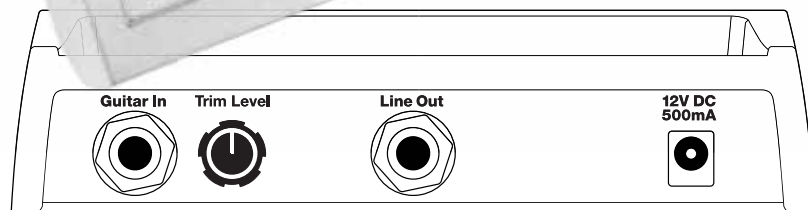

With a cast metal chassis, solid positive-feeling steel step switches and non-skid rubber feet, the DROPTUNE is solidly built for years of use and abuse. LED indicators are bright and easy to see.

If you're ready for instant, hassle-free droptuning, listen to the demos on our website...or better yet, try out the DROPTUNE in person at your Morpheus dealer.

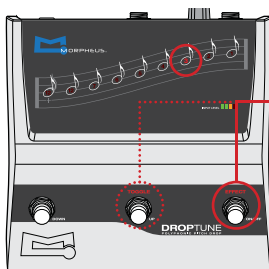

- Proprietary polyphonic pitch drop
- Drop tune up to 3½ steps in ½-step decrements
- Full Octave Drop and Octaver
- Latching EFFECT ON/OFF switch
- Momentary DOWN and TOGGLE/UP switches
- Bright backlit DROP TUNE, OCTAVE, OCTAVER, TOGGLE and EFFECT indicators
- Rear panel TRIM LEVEL control with front panel LED level display
- IN, OUT and power supply jacks (power supply included)
- Patent Pending
- Rugged cast-metal chassis
- Two-year limited warranty

MORPHEUS DROPTUNE

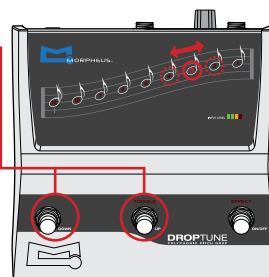

POLYPHONIC PITCH DROP

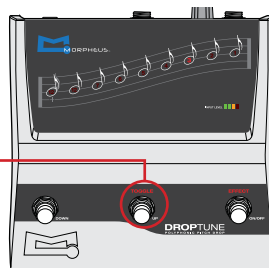

In EFFECT OFF mode, the DOWN switch decrements pitch and the UP switch increments pitch. The note indicators indicate the amount of drop tune. Guitar signal is unaffected until EFFECT ON is selected.

Switching to EFFECT ON engages the selected or previous drop tune setting and also engages the TOGGLE feature. The DOWN switch remains active for decrementing the drop tune.

Press/release the TOGGLE switch to switch back and forth between the drop tune setting and the unaffected guitar signal.
